

# Technical Challenge: Frontend Software Engineering

Welcome to your technical challenge.

This challenge is to validate your ability as a Frontend Software Engineer with Wannabe.

**Deadline:** Wednesday, November 9th, 2022. 11:59 PM CDMX Time.

For this challenge, we expect you to develop an application that uses the Swapi.dev API and deploys it at Vercel.

**Your app must have the following:**

- A view where the user can see a list of the characters returned by the API:  
<https://swapi.dev/>
- The view must have pagination.
- A way to find characters such as filters or a search box.
- A view where the user can see the detail of a specific character.

**Must have:**

- Bootstrap or Tailwind for the UI.
- Server-side rendering for each view in the application.
- Reusable components with included documentation inside the code to explain the logic of each component and how you make it reusable.
- Proper use of git. Please don't upload your project to GitHub with just one commit; we want to see how you use GitHub and how you document each change in your code.

Good Luck!
